

FREE STANDING

Signex Product Cut-Sheet

OVERVIEW -

These signs provide a noticeable identification factor to fit and promote your location and company. As the design elements, applications, and finishes may vary, free standing displays may be modest, architectural in design, or bold and will always make a statement.

WRAPPED BEAMS -

Basic free-standing signs have exposed support beams. More modern ones, however, often incorporate cladding that completely encloses the beams. Hiding the beams creates an extremely clean aesthetic.

COLORS -

All metal components on a free-standing sign can be custom painted to match any color. We use automotive paint for it's extremely durable characteristics. Besides color, many different textures and more complex finishes are possible too.

SIGN CABINET -

One of the most important components of any free-standing sign is the sign cabinet. The signage part of a free-standing sign is an LED illuminated cabinet.

FOUNDATION -

Smaller monument signs are installed on a simple cement pad. Larger pylon signs are supported with either a single steel beam or multiple steel beams. These beams require an 8-10 foot deep cement foundation.
